

Portfolio Simulator - Complete Feature Documentation

Lumpsum

Users enter Portfolio A and Portfolio B with ticker, investment amount, start date, and end date. The module calculates portfolio performance using historical prices. Outputs include Portfolio Value Comparison, Portfolio Normalized Comparison (Base=100), and Portfolio Price Charts. A detailed transaction table is generated containing Ticker, Investment, User Investment Start Date, Actual Buy Date, Buy Price, Units Purchased, End Value, Return Percentage, and XIRR Percentage. This feature helps investors compare one-time investments across multiple assets and determine which portfolio performed better over the selected period.

SIP (Stocks)

Users create Portfolio A and Portfolio B with monthly investment amounts, tickers, start month, and end month. The simulator purchases units every month using historical prices and accumulates holdings. Outputs include Portfolio Comparison Charts, Portfolio Growth Charts, and SIP Breakdown Tables. The SIP calculation table contains Month, Ticker, Price, SIP Amount, Units Bought, Accumulated Units, Investment, Cumulative Investment, Month-End Price, Value, and Return Percentage. Transaction details include Actual Buy Date, Buy Price, Sell Price, End Value, and XIRR calculations.

SWP (Stocks)

The SWP module supports corpus-based withdrawal simulations. Users enter ticker, corpus amount, start month, end month, and withdrawal strategies. Strategy A supports fixed withdrawals such as \$1000 per month. Strategy B supports percentage-based withdrawals such as 1% of portfolio value. Outputs include Portfolio Value Comparison and Monthly Withdrawal Comparison Charts. The breakdown table contains Month, Scheduled Date, Executed Date, Strategy A Value, Strategy A Withdrawal, Strategy A Cumulative Withdrawal, Strategy B Value, Strategy B Withdrawal, and Strategy B Cumulative Withdrawal.

Yahoo Stock Prices

Users enter a stock ticker, start date, and end date. The system retrieves historical prices from Yahoo Finance. Price history can be viewed directly within the application and exported as CSV files for further analysis. This module serves as the primary data source for all portfolio simulations and provides transparent access to historical market information.

Weekly High/Low

Users enter ticker, start date, end date, and select Weekly or Monthly view. The system analyzes historical trading data and identifies high and low prices for each selected period. Results are displayed through interactive charts, helping users identify volatility, trends, and market behavior.

Compare Lumpsum vs SIP

Users enter ticker, amount, start date, and end date. The application compares investing the full amount at the beginning versus investing equal monthly SIP contributions. Results include Total Invested, End Value, Return Percentage, and XIRR Percentage. Additional outputs include Winner Identification, Lumpsum Breakdown Tables, SIP Breakdown Tables, Portfolio Price Charts, and SIP Calculation Breakdown Tables.

Net Worth Estimator

Users enter multiple tickers and units held. The system calculates portfolio net worth between selected dates. Outputs include Portfolio Net Worth Charts, Value by Holding Charts, Portfolio Composition Charts, and Relative Performance Charts indexed to 100. Investors can track portfolio growth and asset allocation.

Net Worth AI

This module extends Net Worth Estimator by integrating AI analysis. Users provide an AI prompt, select AI provider such as Gemini, ChatGPT, or Claude, and enter API credentials. The system generates AI-powered explanations, insights, and portfolio summaries alongside standard net worth charts.

Net Worth GOLD

Users enter ticker, units, start date, and end date. Portfolio values are converted into equivalent gold units. Outputs include Stock Price Charts, Gold Price Charts, and Portfolio-in-GOLD Charts. This enables comparison between stock portfolio growth and gold performance over time.

FX View

Users enter ticker symbol, units held, local currency, target currency, start date, and end date. The system converts portfolio values using historical foreign exchange rates. Outputs include Portfolio Value in Local Currency, Portfolio Value in Target Currency, USD vs INR Comparison Charts, and Summary Breakdown Tables containing Date, Stock Price, FX Rate, Local Value, and Target Value.

Cross-Market

Users enter two tickers from different markets, their currencies, start date, end date, and initial investment amount. The system performs fair cross-market comparisons using historical prices and exchange rates. Outputs include Investments in USD Terms, Investments in INR Terms, Stock Price Charts, and FX Exchange Rate Charts.

SIP Cross-Market

Users create Portfolio A and Portfolio B containing different tickers, currencies, monthly investment amounts, start month, and end month. Historical prices and FX rates are used to calculate portfolio growth. Outputs include SIP Cross-Market Comparison Charts, Stock Price Charts, FX Exchange Rate Charts, and detailed XIRR Breakdown Tables containing XIRR Date, Ticker, Actual Buy Date, Buy Price, Actual Sell Date, Sell Price, Amount Native, Cash Flow USD, Portfolio Value USD, Cumulative Invested, and Gain/Loss.
